Unit 1, Lesson 6**Scaling and Area**

Let's build scaled shapes and investigate their areas.

6.1 Scaling a Pattern Block

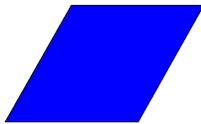

Interactive digital version available

a.openup.org/ms-math/en/s/ccss-7-1-6-1

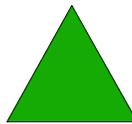

Your teacher will give you some pattern blocks. Work with your group to build the scaled copies described in each question.

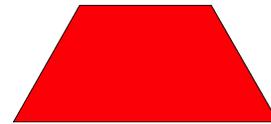

A

B

C

- How many blue rhombus blocks does it take to build a scaled copy of Figure A:
 - Where each side is twice as long?
 - Where each side is 3 times as long?
 - Where each side is 4 times as long?
- How many green triangle blocks does it take to build a scaled copy of Figure B:
 - Where each side is twice as long?

NAME

DATE

PERIOD

- b. Where each side is 3 times as long?
- c. Using a scale factor of 4?
3. How many red trapezoid blocks does it take to build a scaled copy of Figure C:
- a. Using a scale factor of 2?
- b. Using a scale factor of 3?
- c. Using a scale factor of 4?
4. Make a prediction: How many blocks would it take to build scaled copies of these shapes using a scale factor of 5? Using a scale factor of 6? Be prepared to explain your reasoning.

6.2 Scaling More Pattern Blocks

Interactive digital version available

a.openup.org/ms-math/en/s/ccss-7-1-6-2

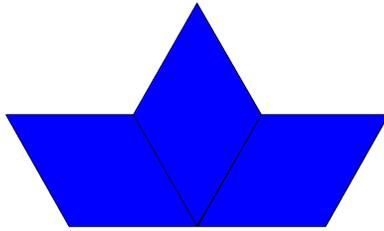

Your teacher will assign your group one of these figures.

NAME _____

D

E

F

1. Build a scaled copy of your assigned shape using a scale factor of 2. Use the same shape of blocks as in the original figure. How many blocks did it take?

2. Your classmate thinks that the scaled copies in the previous problem will each take 4 blocks to build. Do you agree or disagree? Explain your reasoning.

3. Start building a scaled copy of your assigned figure using a scale factor of 3. Stop when you can tell for sure how many blocks it would take. Record your answer.

4. How many blocks would it take to build scaled copies of your figure using scale factors 4, 5, and 6? Explain or show your reasoning.

5. How is the pattern in this activity the same as the pattern you saw in the previous activity? How is it different?

➔ Are you ready for more?

1. How many blocks do you think it would take to build a scaled copy of one yellow hexagon where each side is twice as long? Three times as long?

4. If you drew scaled copies of your figure with the following scale factors, what would their areas be? Discuss your thinking. If you disagree, work to reach an agreement. Be prepared to explain your reasoning.

scale factor	area (cm ²)
5	
$\frac{3}{5}$	

Lesson 6 Summary

Scaling affects lengths and areas differently. When we make a scaled copy, all original lengths are multiplied by the scale factor. If we make a copy of a rectangle with side lengths 2 units and 4 units using a scale factor of 3, the side lengths of the copy will be 6 units and 12 units, because $2 \cdot 3 = 6$ and $4 \cdot 3 = 12$.

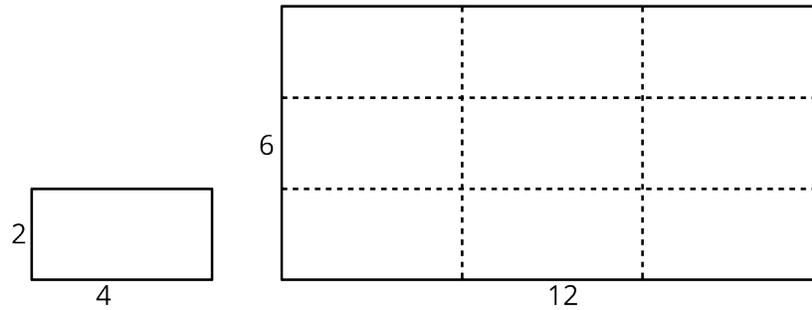

The area of the copy, however, changes by a factor of (scale factor)². If each side length of the copy is 3 times longer than the original side length, then the area of the copy will be 9 times the area of the original, because $3 \cdot 3$, or 3^2 , equals 9.

NAME _____

DATE _____

PERIOD _____

In this example, the area of the original rectangle is 8 units^2 and the area of the scaled copy is 72 units^2 , because $9 \cdot 8 = 72$. We can see that the large rectangle is covered by 9 copies of the small rectangle, without gaps or overlaps. We can also verify this by multiplying the side lengths of the large rectangle: $6 \cdot 12 = 72$.

Lengths are one-dimensional, so in a scaled copy, they change by the scale factor. Area is two-dimensional, so it changes by the *square* of the scale factor. We can see this is true for a rectangle with length l and width w . If we scale the rectangle by a scale factor of s , we get a rectangle with length $s \cdot l$ and width $s \cdot w$. The area of the scaled rectangle is $A = (s \cdot l) \cdot (s \cdot w)$, so $A = (s^2) \cdot (l \cdot w)$. The fact that the area is multiplied by the square of the scale factor is true for scaled copies of other two-dimensional figures too, not just for rectangles.
